“Excellent product to help smooth out the post calving transition!”

Jon Bakker of Hoftzyer Farms, Frankford, Ontario, Milks 110 Holsteins in a three-robot freestall facility.

“For those wanting to reduce cases of clinical ketosis or just get fresh cows off to a better start, Nia Energy Gel is an excellent product to help smooth out the post calving transition. It can be used as standard protocol on any at-risk cow; early calving, twins, off feed, retained placenta, etc. It just feels right to be giving a cow a preventative measure rather than corrective if she does become sick and a vet call is needed.”
